Perspective

AT FIRST SIGHT

Once made, this stolid mauve powder would seem forever;

but people intent on reproduction fire up pots next door

or across the sea, and out of the odd one crystallizes

another, the same, but for a tell-tale (to X-rays) part

that twists a tad; in a tango of attractions and absences

molecules nestle in a variant pattern. Neat, but from here on,

the first won't be made; or so it seems, the ur-makers once

patient hands grow limp has desire fled? In all flasks

the second precipitates. Who, oh who, is to blame? Yes, lay it

to the other coming—as if seed crystals flew the world.

But the first is the accident, a small well in a chanced

landscape, a nicked knife edge, the one parcel of phase space

never to be sampled again, the vanishing polymorph...you.

This poem owes much to an article by Jack D. Dunitz and Joel Bernstein in *Acc. Chem. Res.* **1995**, *28*, 193–200.
